11th International Conference on Biological Invasions: The Human Role in Biological Invasions - a case of Dr Jekyll and Mr Hyde?
A pipeline for feeding headline indicators on the state of invasions and to prioritize emerging alien species

Abstract

Imagine you’re automatically alerted when new alien species appear in your country, new introduction pathways open or an established species jumps out of its lag phase and increases in protected areas. We showcase an operational workflow generating indicators for invasions based on openly published checklist and occurrences data on GBIF using data from the TriAS project in Belgium. Checklist based indicators at country level include the (cumulative) number of introductions of alien species in time and the pathways associated with alien species introductions. R functions were developed to break this down to taxa, environments, native ranges and degree of establishment. Indicators can be restricted to the Union Concern species of the EU IAS Regulation. Second, we developed occurrence based indicators to provide information at species level. Pre-processing creates an occurrence cube for alien taxa with data aggregated at 1km level. From this cube we build indicators of (re)appearing and emerging species in Belgium. Emerging species show a significant increase in their occupancy or number of observations in recent years. Generalized Additive Modeling and simple decision rules were applied to analyse time series of occupancy and number of observations inside and outside protected areas of the NATURA2000 network. We used all data on alien and native species at the rank of class as a covariate to compensate for survey effort bias. Several ranking procedures were then applied to create a prioritized list of species to inform decision making and provide trend information useful for risk assessment and risk management. The seamless, open data flows and open software tools allow for yearly updates when new checklist information or new datasets are added to GBIF. As such, it can easily be applied to other countries or regions of the world wanting to strengthen their evidence base for IAS policy and management.
